## SUMMARY

---

Passionate and motivated Full Stack Developer with hands-on experience in building scalable web applications using the MERN stack. Skilled in JavaScript, Node.js, Express.js, React, and MongoDB, with a strong understanding of RESTful APIs and JWT-based authentication. Familiar with modern development practices such as MVC architecture, Git, and deployment on cloud platforms. Adept at solving real-world problems through clean, efficient, and maintainable code. Quick learner with the ability to adapt to new technologies and project requirements. Strong foundation in backend logic, database design, and API security. Committed to writing optimized and reusable code. Excellent teamwork and communication skills with a proactive mindset. Seeking an opportunity to contribute to a growth-oriented organization while continuously enhancing technical expertise.

## Education

---

**Bachelor's in Computer Science** (Comsats, Lahore)

(Feb 2022 – Jan 2026)

**Relevant Coursework:** OOP, Web Tech, DSA, OS, DBMS

## SKILLS

---

**Frontend:** React, React Native, HTML, CSS, JavaScript, jQuery, Bootstrap, Tailwind CSS

**Backend:** Node.js, Express.js, Python,

**Databases:** MongoDB, SQL

**Tools & Practices:** REST APIs, Git, VS Code, JWT Auth, Redux

## EXPERIENCE

---

**Devorbis** — *Software Engineering Intern (Paid Internship)*

*Feb 2026– Present | Lahore, Pakistan*

- Engineered a scalable healthcare backend using **Node.js, Express, and MongoDB**, supporting complex scheduling and patient-doctor appointment workflows. ·
- Implemented secure role-based access control (RBAC) with **JWT** and designed database indexing to automatically prevent double-bookings. ·
- Integrated **Multer and Cloudinary** for secure medical document uploads and utilized MongoDB aggregations for real-time rating calculations.

## PROJECTS

---

**FarmConnect** — Agriculture E-commerce Platform

- Developed FarmConnect, a MERN-stack based digital agriculture platform connecting farmers, buyers, and suppliers.
- Implemented role-based authentication (Farmer, Buyer, Supplier) using JWT and secure cookies.

- Designed and developed RESTful APIs for user registration, login, profile management, and password recovery with OTP verification.
- Enabled farmers and suppliers to upload and manage products, including pricing and availability.
- Utilized MongoDB for efficient data modeling and relational handling across users, products, and orders.
- Implemented secure authorization middleware to protect routes based on user roles.
- Deployed the backend on a cloud platform with environment-based configuration management.
- Focused on solving real-world agricultural market challenges by reducing middlemen and improving transparency.

## Video & Social Media Platform — Backend Development

- Developed a scalable backend for a video-based social media platform enabling users to create accounts, publish videos and posts, interact through likes and comments, manage subscriptions, and organize content via playlists
- Implemented **JWT-based authentication** with secure access control for protected routes and user-specific operations.
- Designed and developed **RESTful APIs** for user registration, login, profile management, video uploads, post creation, likes, comments, subscriptions, and playlist management.
- Structured backend logic using **modular MVC architecture** to ensure scalability, maintainability, and clean separation of concerns.
- Modelled complex relationships between users, videos, posts, comments, and playlists using **MongoDB and Mongoose**, enabling efficient querying and data consistency.
- Implemented **authorization middleware** to restrict actions based on ownership (e.g., video deletion, playlist modification).
- Integrated **input validation, centralized error handling, and API response standardization** to improve security and reliability.
- Optimized backend performance by designing efficient database queries and indexing frequently accessed fields.
- Focused on building a production-ready backend capable of supporting **high user interaction and content-driven workflows**.

## HealthCare Appointment Platform— Backend Development

- Developed a secure and scalable backend for a healthcare platform enabling patients to book appointments, upload medical history, and leave reviews, while allowing doctors to manage availability and issue prescriptions.
- Implemented strict Role-Based Access Control (RBAC) and JWT-based authentication to securely isolate Patient, Doctor, and Super Admin workflows and protect sensitive routes.
- Designed and developed RESTful APIs for user onboarding, real-time appointment scheduling, prescription generation, medical document uploads, and dynamic rating systems.
- Structured backend logic using a modular MVC architecture, integrating custom asynchronous error handlers and standardized API responses to ensure maintainability and reliability.
- Modelled complex data relationships (1:1, 1:N, M:N) between Users, Doctor Profiles, Appointments, and Medical Records using MongoDB and Mongoose for efficient querying.
- Engineered compound database indexing on the appointment schema to algorithmically prevent scheduling conflicts and double-bookings at the database level.
- Integrated Multer and the Cloudinary API to handle secure, cloud-based file uploads for sensitive patient lab reports and medical documents.
- Utilized MongoDB Aggregation Pipelines to process patient feedback and dynamically calculate and update doctor ratings and review counts in real-time.
- Enforced strict authorization middleware to restrict actions based on ownership and status, ensuring patients can only review completed appointments and doctors can only manage their specific patients.
